

1.1 Cable Access Method

Cable access enables remote sites to be connected to the Business VPN using fiber technology. It is used in a restricted group of countries to improve the Business VPN's geographic coverage. It has country-specific characteristics and is available for Business VPN Small only. If Customer elects to purchase cable access to enable access to the Orange MPLS Network, then Orange will provide, install, and manage the CE and the port configured to support the DSL access downstream speed. This service will connect to the MPLS network via the public Internet.
